

ROBIN STAHLBAUM

Senior Infrastructure Engineer · Linux · SRE · Edge AI Systems Architect Mississauga, ON | 416-624-9881 | rstahlb@gmail.com | [://github.com](https://github.com/rstahlb) | rstahlb.github.io

OBJECTIVE

Throughout 20+ years of enterprise Linux and Windows systems engineering, one thread has remained constant: identifying the problem before anyone else does, architecting the solution, and owning it end to end until it works. From managing mission-critical financial infrastructure at Scotiabank to hardening secure access layers for global media platforms at Bell, the approach never changes — define the problem clearly, build the right solution, and deliver it with no loose ends. Now seeking a role where that same mindset is applied to enterprise Linux infrastructure, SRE practices at scale, and edge AI systems optimization.

CORE EXPERTISE

SECURITY & ACCESS	INFRASTRUCTURE & SRE
Bastion hosts / jump servers — architecture	Linux — RHEL, Ubuntu, Solaris legacy environments
SSH ProxyJump — secure, mediated remote access	VMware vSphere / ESX / OpenStack / QEMU
MFA & Privileged Access Management (PAM)	Large-scale enterprise system operations
Public-key authentication & credential hardening	Incident response, postmortems & SRE practices
Firewalld / UFW — network isolation & access control	Ansible automation & configuration management
AD / RBAC integration for access governance	CPU, memory, storage & network performance tuning

CLOUD & SYSTEMS	EDGE AI & COMPUTE ENGINES
AWS / GCP hybrid infrastructure environments	Agent Cognition & Multi-Agent Orchestration (MoA)
LVM storage architecture & optimization	LoRA Fine-Tuning Pipelines & RLHF Data Alignment
Oracle RAC / MySQL database environments	Apple Silicon Memory Optimization (16GB RAM Boundary)
PCI-compliant banking infrastructure	Language Interoperability (Swift / Modern C++ Interop)
Change management — CAB, RFC, risk analysis	High-Performance Local-First Data Routing Layers

PROFESSIONAL EXPERIENCE

Infrastructure & Linux Administrator — Total Cyber Solution | 2024 – Present

- Define architecture specifications and deliver secure, end-to-end infrastructure solutions for enterprise clients from initial proof-of-concept through production deployment.
- Architected and deployed high-performance local AI orchestration networks, managing temporal multi-agent systems and on-device contextual caching matrices natively inside resource-constrained environments (16GB RAM boundaries).
- Designed an intelligent semantic AI routing engine using Python, leveraging model-judgment layers to dynamically parse user prompt intents and procedurally delegate compute tasks across specialized local downstream nodes (e.g., Llama 3 to Qwen Coder loops).
- Executed hardware-accelerated model training and fine-tuning pipelines using PyTorch and Low-Rank Adaptation (LoRA) on Apple Silicon Metal Performance Shaders (MPS), achieving a verified 95% text classification threat accuracy rating.
- Engineered native cross-platform compliance utilities (SwiftUI/WidgetKit) that parse real-time global vulnerability databases and automate visual alert escalations for overdue CISA remediation deadlines.
- Programmed low-overhead systems language interoperability pipelines, building native Objective-C++ bridging layers to safely map multi-threaded C++ graphics runtimes and the Jolt Physics SDK to Swift execution threads.
- Write robust Python and Bash automation frameworks to eliminate manual toil, manage server lifecycles, and handle secure local sandbox data routing.

Linux Administrator / Site Reliability Engineer — Bell Media | Apr 2024 – Apr 2025

- Supported high-traffic global content delivery systems using Akamai CDN — identified bottlenecks and owned resolution.
- Maintained 24/7 infrastructure availability for media broadcasting platforms.
- Led incident response, postmortem analysis, and systemic fix implementation — not just symptom patching.
- Deployed and managed hardened Linux bastion (jump) hosts to secure administrative access into broadcast platform infrastructure — enforced SSH key-based authentication and restricted inbound access to trusted source IPs.
- Used Python and Bash scripting to automate routine administration tasks and streamline day-to-day operations.

Site Reliability Engineering Specialist — Bell Canada (Contract) | 2022 – 2024

- Built and maintained RHEL-based VMware/OpenStack environments at scale.
- Designed Ansible automation for provisioning, patching, and config management — reducing manual toil across the fleet.
- Implemented security hardening with Red Hat Satellite and STIG standards; designed firewall and routing with security teams.
- Architected and deployed hardened Linux bastion (jump) hosts as the sole administrative entry point into production environments — enforced SSH key-only authentication and MFA, disabled root/password logins, and restricted inbound access via firewall rules to trusted source IPs.
- Wrote Python and Bash scripts to automate day-to-day administration, provisioning, and system health checks.

Linux Infrastructure & Automation Engineer — Route1 | Feb 2019 – May 2020

- Managed AWS, ESX, and bare-metal Linux environments end-to-end for production systems.
- Owned storage scaling using LVM — identified capacity problems before they became incidents.
- Standardized Ansible automation across heterogeneous systems; ensured SLA compliance under strict change control.

- Provisioned and hardened Linux bastion/jump hosts to provide secure, mediated SSH access to production and bare-metal environments — configured SSH ProxyJump workflows and firewall-based network isolation.
- Developed Python and Bash scripts to automate day-to-day administrative tasks across AWS, ESX, and bare-metal environments.

Senior Systems Administrator / DevOps Engineer — Symcor (Contract) | Aug 2017 – Oct 2018

- Supported mission-critical financial check processing platforms — zero tolerance for ambiguity.
- Owned Linux performance tuning and certificate lifecycle management end to end.
- Led CAB change management and production release governance; primary escalation for enterprise incidents.
- Used Python and Bash scripting for day-to-day system administration and to automate certificate lifecycle and performance-tuning tasks.

Senior Linux Administrator, Global Wealth Management — Scotiabank | 2010 – Aug 2017

- Provisioned and maintained RHEL environments on VMware vSphere supporting PCI-compliant financial systems.
- Primary escalation point for offshore engineering teams — defined the problem, built the fix, closed the loop.
- Built Ansible automation for server updates, deployments, and configuration management across the estate.
- Managed GlassFish, Tomcat, and Apache application servers for enterprise banking applications.
- Developed Bash and Python automation scripts that eliminated recurring manual operational tasks.
- Led proof-of-concept implementations for new banking products; trained new hires on compliance and operational process.
- Conducted comprehensive account auditing and access control verification across Windows and Linux systems.
- Designed and hardened bastion/jump host infrastructure providing secure, mediated SSH access to PCI-compliant banking systems — implemented SSH ProxyJump workflows, public-key authentication, and MFA to eliminate direct exposure of internal management ports.

Escalation Engineer, Hosted Team — VMware | 2004 – 2010

- Resolved enterprise-level VMware ESX and Virtual Center issues — owned cases from open to closed.
- Collaborated with engineering teams on defect reproduction and fixes; trained engineers on escalation methodology.

Enterprise Support Engineer, Performance — Microsoft (Contract) | 2003 – 2004

- Provided advanced performance troubleshooting for enterprise customers on large-scale Microsoft environments.
- Diagnosed and resolved system-level issues across high-value production deployments.

TECHNICAL SKILLS

- **Linux:** RHEL, Ubuntu, Solaris — 20+ years production administration
- **Languages & Interop:** Swift, Modern C++ (C++17/20), Objective-C++, Python (PyTorch), Bash, JSON
- **Local AI & Compute:** Agent Cognition, Multi-Agent Orchestration, LoRA, RLHF, MPS, CoreML, HuggingFace

- **Security & Compliance:** CISA KEV Tracking, CVE Feeds, Bastion Hosts, SSH ProxyJump, Keychain, PAM
 - **Virtualization:** VMware ESX/vSphere, OpenStack, QEMU — enterprise scale
 - **Automation:** Ansible, Bash scripting, Python — configuration management & operational tooling
 - **Storage:** LVM, SAN, enterprise storage — architecture, scaling, optimization
 - **Databases:** Oracle RAC, MySQL — production DBA support
-

EDUCATION & CERTIFICATIONS

- CompTIA A+
- Red Hat Linux Training — RHEL 5, 6, 7
- VMware ESX Training — versions 2 through 4
- Solaris 11 Administration Training
